

名前 _____ 日付 _____ / _____

QUESTION

Read the article below and summarize it in your own words as far as possible in English. Summarize it between 60 and 70 words.

以下の記事を読み、できる限り自分の言葉を使って英語で要約しなさい。60～70語で要約しなさい。

READING

Flooding can develop quickly when heavy rain causes rivers to rise. Traditional forecasts rely on weather information, water measurements, and maps, but it can be difficult to understand how these factors will affect every part of a river. In response, digital models that reproduce rivers in virtual space are beginning to be used by local authorities and researchers responsible for disaster planning.

Supporters say these models offer important advantages. One example is earlier flood prediction. By combining data on rainfall, water levels, river shapes, and nearby land, they can simulate how water may move and identify areas likely to flood first. In addition, officials can use the results to issue clearer warnings and tell residents when to leave before water reaches homes or roads. This can support more efficient evacuation.

However, critics identify possible problems. Predictions may be wrong if sensors fail or if information about rainfall, river depth, buildings, or land conditions is incomplete or outdated. People might then receive unnecessary warnings or fail to leave dangerous areas. The systems are also costly to run and maintain. Authorities need computers, sensors, specialist staff, secure networks, and regular updates whenever river conditions or surrounding communities change.

要約は2ページ目に書きます。記事の和訳は載せていません（読む練習のため）。答え合わせはQRから。
