## QUESTION

Read the article below and summarize it in your own words as far as possible in English. Summarize it between 60 and 70 words.

以下の記事を読み、できる限り自分の言葉を使って英語で要約しなさい。60～70語で要約しなさい。

## READING

Infectious diseases can spread through communities before all cases are identified through individual testing or hospital reports. To monitor these changes more broadly, health authorities are becoming interested in a method called wastewater-based epidemiology, or WBE. This approach examines sewage for viruses and other materials connected with disease. Since infected people may leave these signs in wastewater, samples from treatment plants can reveal changes in disease activity across a community.

Supporters say WBE has an important benefit. Information found in wastewater may show that an infectious disease is becoming more common before many sick people visit medical facilities or receive test results. Thanks to such signs, officials may notice an increase and recognize that infections are probably spreading at an early stage.

On the other hand, critics point out possible problems. It cannot show the exact number of infected people because the amount of material released differs between individuals and results may be affected by rain, industrial water, or sampling methods. The same reading may therefore represent different levels of infection in different places. There is another concern. When high levels are linked to a particular neighborhood, outsiders may unfairly regard its residents as careless or dangerous without understanding the reasons behind the result.

要約は2ページ目に書きます。記事の和訳は載せていません（読む練習のため）。答え合わせはQRから。
