

名前 _____ 日付 _____ / _____

QUESTION

Read the article below and summarize it in your own words as far as possible in English. Summarize it between 60 and 70 words.

以下の記事を読み、できる限り自分の言葉を使って英語で要約しなさい。60～70語で要約しなさい。

READING

Counting wild animals is important for understanding changes in ecosystems and protecting species. Traditionally, researchers have observed animals directly or used traps and tracking devices to collect information. Recently, some projects have begun using artificial intelligence (AI) together with cameras. These systems examine recorded images and automatically identify animals, helping researchers estimate how many individuals of each species live in an area.

Supporters say this method has several advantages. Unlike human observers, AI-based cameras can continue monitoring animals at night or during bad weather. This makes it possible to collect information for longer periods without depending heavily on working conditions. There is another benefit. Researchers do not need to catch animals or attach tracking devices to their bodies. As a result, the survey can collect useful information while causing less stress or physical disturbance to wildlife.

However, critics point out a problem. There are various factors that can reduce the accuracy of AI identification. For example, heavy rain, moving plants, or darkness at night may make recorded images difficult to analyze correctly. As a result, the system may mistake one animal for another or fail to recognize an animal completely. Such errors could make estimates of wildlife populations less reliable.

要約は2ページ目に行きます。記事の和訳は載せていません（読む練習のため）。答え合わせはQRから。

スマホで読み取ると、書いた英文をその場でAIが添削します。
