名前 _____ 日付 _____／_____

QUESTION

Read the article below and summarize it in your own words as far as possible in English. Summarize it between 90 and 110 words.

以下の記事を読み、できる限り自分の言葉を使って英語で要約しなさい。90〜110語で要約しなさい。

READING

Large quantities of plant-based products, including fruit, young plants, and timber, are traded across national borders every day. This commerce supports agriculture and construction, but it can also move unwanted organisms from one region to another. Insects, eggs, fungi, or other pathogens may remain hidden on plants, packaging, or wood during transport. If they survive the journey and enter a place where they were previously absent, they may establish new populations. Because international trade connects distant ecosystems more quickly than natural movement would, even a small number of contaminated shipments can create opportunities for agricultural pests to spread.

The consequences can be severe when introduced pests encounter few natural enemies. Their populations may expand rapidly and damage crops, forests, or other valuable vegetation. Farmers can lose harvests, while forestry businesses may face reduced timber supplies or higher management costs. Governments and landowners may also need to spend large amounts on monitoring, pesticides, removal programs, or quarantine measures once an invasive pest becomes established. In some cases, complete eradication is no longer possible, meaning that control costs continue for many years. The economic burden can therefore extend far beyond the original shipment that carried the organism.

To reduce these risks, governments can strengthen inspections of imported plants and require treatments that kill pests before goods enter the country. Heat treatment, cleaning, or other procedures can lower the chance that harmful organisms survive transportation. However, such measures have important limitations. Very small insects, eggs, or pathogens can be difficult to detect, especially when huge volumes of cargo must be examined quickly. More thorough inspection also takes time and requires trained staff and specialized facilities. If controls become too strict or slow, shipments may be delayed and trading costs can rise. Authorities must therefore balance effective biosecurity with the need to keep international commerce moving efficiently.

要約は2ページ目に書きます。記事の和訳は載せていません（読む練習のため）。答え合わせはQRから。
