名前 _____ 日付 _____／_____

QUESTION

Read the article below and summarize it in your own words as far as possible in English. Summarize it between 90 and 110 words.

以下の記事を読み、できる限り自分の言葉を使って英語で要約しなさい。90〜110語で要約しなさい。

READING

Beaches naturally change shape as waves and currents move sand along the coast. In some areas, however, sea-level rise and coastal development are causing shorelines to retreat more quickly than they did in the past. Seawalls, ports, and other structures can also interrupt the natural movement of sediment, leaving certain beaches with less sand. As the beach becomes narrower, there is less space between the ocean and nearby buildings, roads, and other infrastructure. In places where beaches already provide only a narrow buffer, even moderate erosion can significantly increase exposure to the sea.

The loss of sand can increase the damage caused by storms and high tides. A wide beach helps absorb wave energy before it reaches developed areas, but a narrow one offers less protection. As a result, homes, roads, and public facilities may be exposed more directly to flooding and erosion. Coastal tourism can also suffer if popular beaches become too small or unattractive for visitors. In addition, beaches provide habitat for plants and animals that depend on sandy shorelines for feeding, nesting, or breeding. Continued erosion can therefore create both economic and environmental problems for coastal communities.

One response is beach nourishment, in which large amounts of sand are brought from another location and added to an eroding shoreline. Rebuilding the beach can provide temporary protection while also preserving recreational space. However, the added sand is still affected by waves and currents, so it may gradually wash away and require repeated replacement. These projects can therefore become expensive over time. Finding suitable sand can create another difficulty. Material taken from the seabed or other coastal areas may disturb habitats or alter sediment movement at the source. Consequently, beach nourishment can reduce erosion in one location while creating new environmental pressures elsewhere.

要約は2ページ目に書きます。記事の和訳は載せていません（読む練習のため）。答え合わせはQRから。
